Problem Statement

Food wastage is a major social and environmental issue, especially in urban areas. Hotels, restaurants, and catering services often generate large amounts of surplus food due to overproduction, unpredictable demand, and strict quality standards. Most of this excess food is discarded despite being safe for consumption.

At the same time, many Non-Governmental Organizations (NGOs), shelters, and community kitchens face a constant shortage of food and struggle to serve underprivileged populations. The lack of a centralized and efficient communication system prevents timely coordination between food donors and NGOs. As a result, edible food is wasted while people remain hungry.

Existing food donation processes are mostly manual, unorganized, and inefficient, leading to delays, food spoilage, and lack of accountability. Therefore, there is a need for a digital platform that can effectively connect food donors with NGOs, ensure timely redistribution of surplus food, and reduce food waste in a structured and transparent manner.

Proposed Solution

The proposed system is a Food Redistribution Platform that digitally connects hotels, restaurants, and food providers with NGOs and charitable organizations in real time. The platform enables food donors to list details of excess food such as quantity, type, and availability time. NGOs can view available donations and place food requests based on their requirements and location.

The system includes a matching mechanism that connects nearby donors and NGOs to minimize transportation time and food spoilage. Pickup scheduling and delivery status tracking ensure smooth coordination between all parties involved. Notifications are used to inform users about donation acceptance, pickup schedules, and delivery updates.

An admin module monitors platform activity, manages user verification, and generates reports on food redistribution and social impact. The system also includes food safety declarations, feedback mechanisms, and basic analytics to ensure trust, transparency, and accountability.

By providing a structured and efficient digital solution, the proposed system aims to reduce food wastage, support NGOs in feeding the needy, and promote social responsibility through technology.
